**Color Review**

There are 3 properties of color: **hue, value and intensity**

- **Hue** - another term for color
- **Value** - 1 of the 7 elements of design that shows how light or dark a color is
- **Intensity** - how bright or dull a color is

Adding these components changes the way a color looks:

- **Tint** - when white is added to a color it makes the color lighter
- **Shade** - when black is added to a color it makes the color darker
- **Complement** - colors opposite each other on the color wheel
- **Analogous** - colors next to each other on the color wheel

Mixing a **tint** makes the **value lighter and intensity is lost**
Mixing a **shade** makes the **value darker and intensity diminishes**
Adding a **neutral** color does not change the value and the intensity lessens
Mixing **complements** creates neutral colors and dulls the intensity

Placing **complements next to each other** creates **contrast** in a picture as complements share no common colors

The **visible resource for color** is the “**Color Wheel**”
The 3 complementary pairs are: Red/Green, Yellow/Purple, Blue/Orange
